What Does the Brain Do?

What's a Brain Made Of?

100 billion neurons!

Even MORE glia

The Neuron

How Does the Brain Work?

1 quadrillion synapses!!

Electrical Signals: Digital

The Action Potential! - how a message gets passed *inside a cell* from the dendrites to the axon

Chemical Signals: Analog

Synapse - where the axon of one cell passes its message on to the dendrites of another cell using neurotransmitters

From Sensation to Action

Your nervous system is like a relay race - passing on messages from one neuron to another, going from sensation to action

The whole brain communicates
to generate behaviors
